* Unit performance measured according to ISO 1217, Annex E, Edition 4:2009
True Life Cycle Cost = Purchase Price + Energy Costs + Parts and Service + Additional Factors

- **Purchase Price**
  This is the "upfront" portion of your investment. Over time, the impact of this expense becomes less significant, especially in units that run with minimal downtime over a long life.

- **Parts and Service**
  This cost can vary depending on the type of unit purchased and the application it performs. In all cases, this expense can be calculated by considering the cost and schedule of regular maintenance as a baseline. High stress or demanding applications should also consider the availability of genuine replacement parts and the cost of repairing or replacing key components.

- **Energy Costs**
  Over the operating life of your compressor, energy is the greatest share of your true life cycle cost. Additionally, energy expenses often fluctuate, and these price changes can directly impact your overall profitability. Consider placing an emphasis on units that come with more energy efficient features to help minimize the impact of energy costs throughout your compressor’s operational life.

- **Additional Factors**
  In addition to purchase price, parts/service and energy costs, you should also consider any applicable factors based on the needs of your application and configuration of your compressor. These can include (but are not limited to):
    - Load profile
    - Unloaded energy costs
    - Energy recovery
    - Pressure drops across equipment and piping
    - Demand charges
    - Dryer energy costs
    - Auxiliary equipment energy costs
    - Load/unload cycle time
    - Bleed-down losses
    - Non-production operation
    - Artificial demand
    - Air leak losses
    - Project engineer recommendations
    - System pressure set points
